$\text{volume} = \text{peakAmp}; \text{sample}[n] = \text{volume} * \sin(\text{phase});$ } A basic envelope can be produced with only attack, sustain and release segments, but we often need to produce more complex envelopes. For example, a traditional synthesizer uses a four segment ADSR type envelope like the one shown below.

A software synthesis system needs both instruments to make sounds and a way to control the instruments. By analogy, the synthesizer includes an "orchestra" and a "score." The orchestra consists of the definition of the sound generation instruments, while the score consists of input to the sequencer.

Software Synthesis

The representation of a signal by a set of samples is the foundation of all digital audio systems, including both CD audio and digital sound synthesizers. Since the sound is represented by a set of numbers, a computer can calculate the sample values directly rather than by sampling an analog input signal. Simply put, a digital sound synthesizer produces sound by generating a series of samples representing the instantaneous amplitude of the signal at a constant time interval.
