Ada is a structured, statically typed, imperative, and object-oriented high-level programming language, extended from Pascal and other languages. It has built-in language support for design by contract (DbC), extremely strong typing, explicit concurrency, tasks, synchronous message passing, protected objects, and non-determinism. Ada improves code safety and maintainability by using the ...

Ada is the programming language of choice for high integrity software systems and is used extensively in industries such as transportation and aerospace. This textbook is intended for experienced programmers (advanced students and practicing software engineers) who need to master software design and programming in Ada.

The second irony is that the Ada mandate, meant to force DoD software projects to catch up with progress in software engineering by retiring older approaches, has also had in the ensuing years the probably unintended effect of slowing down the adoption of newer (post-Ada) technology by the military-aerospace community. The lessons of Ada remain irreplaceable, and it is a pity that many of the O-O languages

Norman Cohen's book "Ada as a second language" is very approachable, but only covers topics up to Ada95 (Ada 2005) therefore not covered. For concurrent programming in Ada, a great resource is "Concurrency by Ada", again by Burns and Wellings. This book covers topics up to Ada95.

Provides complete coverage of the Ada language and Ada programming in general by recognized authorities in Ada software engineering. Demonstrates the power and performance of Ada in the management of large-scale object-oriented systems, and shows how to use Ada features such as generics, packages, and tasking.

These proceedings include tutorials and papers presented at the Sixth CSR Conference on the topic of Large Software Systems. The aim of the Conference was to identify solutions to the problems of developing and maintaining large software systems, based on approaches which are currently being undertaken by software practitioners. These proceedings are intended to make these solutions more widely available to the software industry. The papers from software practitioners describe:

- important working systems, highlighting their problems and successes;
- techniques for large system development and maintenance, including project management, quality management, incremental delivery, system security, independent V & V, and reverse engineering.

In addition, academic and industrial researchers discuss the practical impact of current research in formal methods, object-oriented design and advanced environ

ments. The keynote paper is provided by Professor Brian Warboys of ICL and the University of Manchester, who masterminded the development of the ICL VME Operating System, and the production of the first database-driven software engineering environment (CADES). The proceedings commence with reports of the two tutorial sessions which preceded the conference: • Professor Keith Bennett of the Centre for Software Maintenance at Durham University on Software Maintenance; • Professor John McDermid of the University of York on Systems Engineering Environments for High Integrity Systems. The remaining papers deal with reports on existing systems (starting with Professor Warboys' keynote paper), approaches to large systems development, methods for large systems maintenance and the expected impact of current research.

Advances in Electrical Engineering and Computational Science contains sixty-one revised and extended research articles written by prominent researchers participating in the conference. Topics covered include Control Engineering, Network Management, Wireless Networks, Biotechnology, Signal Processing, Computational Intelligence, Computational Statistics, Internet Computing, High Performance Computing, and industrial applications. Advances in Electrical Engineering and Computational Science will offer the state of art of tremendous advances in electrical engineering and computational science and also serve as an excellent reference work for researchers and graduate students working with/on electrical engineering and computational science.

program. An overview of the various issues involved is followed by a description of the implementation procedure. The setting is a training department in a commercial environment. The existing staff have various technical, teaching, and course development skills but no ADA experience. One consideration is whether to hire an ADA expert from outside or develop ADA expertise from within. Another concern is how to determine goals and objectives for the ADA training program. A discussion of the different training materials to be developed is coupled with a description of the methods used for obtaining necessary resources. Finally, means of evaluating the quality of training are discussed. Keywords: Syntax; High level languages.

Software Engineer's Reference Book provides the fundamental principles and general approaches, contemporary information, and applications for developing the software of computer systems. The book is comprised of three main parts, an epilogue, and a comprehensive index. The first part covers the theory of computer science and relevant mathematics. Topics under this section include logic, set theory, Turing machines, theory of computation, and computational complexity. Part II is a discussion of software development methods, techniques and technology primarily based around a conventional view of the software life cycle. Topics discussed include methods such as CORE, SSADM, and SREM, and formal methods including VDM and Z. Attention is also given to other technical activities in the life cycle including testing and prototyping. The final part describes the techniques and standards which are relevant in producing particular classes of application. The text will be of great use to software engineers, software project managers, and students of computer science.

Software Engineer's Pocket Book provides a concise discussion on various aspects of software engineering. The book is comprised of six chapters that tackle various areas of concerns in software engineering. Chapter 1 discusses software development, and Chapter 2 covers programming languages. Chapter 3 deals with operating systems. The book also tackles discrete mathematics and numerical computation. Data structures and algorithms are also explained. The text will be of great use to individuals involved in the specification, design, development, implementation, testing, maintenance, and quality assurance of software.

Ada 95 is the first fully object-oriented programming language to be internationally standardized. John Barnes was a key member of the language's design team, and this is a new edition of his definitive text and reference for the Ada 95 language.
